Victoria Chu

Getting to your linux terminal

Overview

What is Linux?

It is a UNIX based operating system.

How do I use Linux?

You type commands into a terminal that does things for you

What commands do I need to know from Linux?

You really only need 3 cd, ls, and vi to navigate and create files within your own filesystem for the purpose of a webapp.

There are others tho like rm, mv, cat, pwd, touch, ps -ef, netstat -tulpn, etc. but you will probably discover these on your own as you ask yourself questions about what you need.

How do I install things on Linux?

Sudo apt-get install <insert thing to install here> or yum install for CentOS

What do I do when linux won't let me do stuff?

Sudo or you could change the permissions with chmod, chown and such but probably just sudo should suffice since you all have root access to your virtual machines.

Why Linux?

Windows isn't the best. But if you really want to know here's a good article:

<http://www.techrepublic.com/blog/10-things/10-things-linux-does-better-than-windows/>

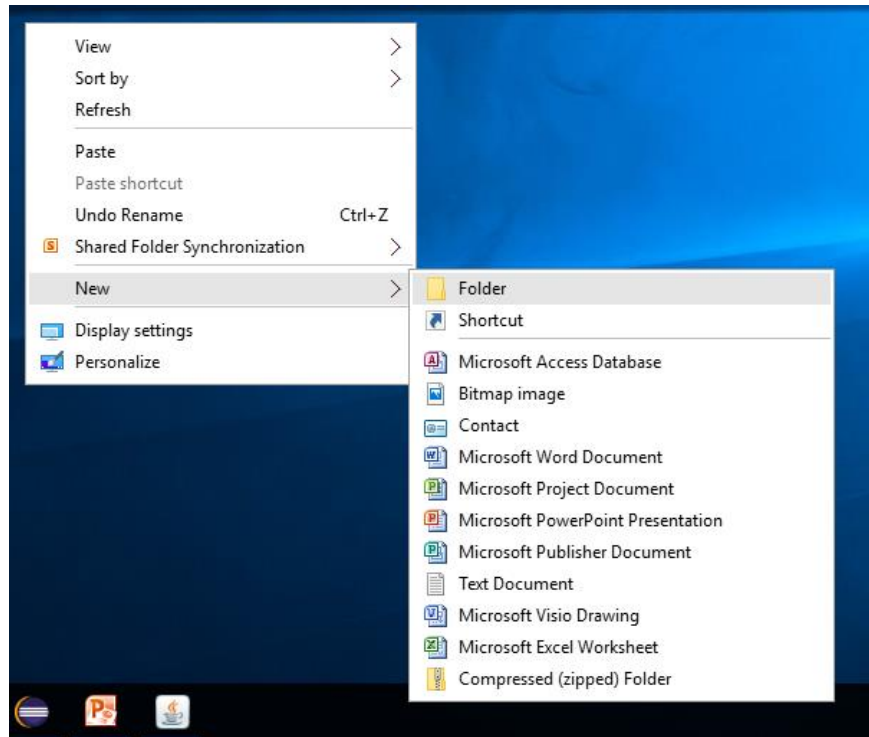

A simple follow along tutorial on linux

- How do I navigate my file system?
 - Commands covered:
 - cd
 - ls
 - vi
 - rm
 - mv
 - mkdir
 - touch
 - man
- How do I install stuff?
 - Commands covered:
 - Apt-get install
 - Apt-get purge
 - Apt-get remove
 - Apt-get update
 - Apt-get upgrade
 - Sudo
 - Pwd
 - Ctrl-c,ctrl-z,ctrl-d
- How do I get more points on my next CyberPatriot competition involving linux?
 - Commands covered:
 - netstat -tulpn
 - ps-ef
 - | less
 - cat
- How do I do fancy stuff like shell scripts, bashrcs, vimrcs, and cronjobs, and what do all these filenames mean
 - Commands covered
 - Cron?
 - tmux?
- How do I customize my terminal?
 - Commands covered
 - Alias
 - Bashrcs
 - Apt-get install sl

Navigating your file system.

mkdir- make a directory

Windows

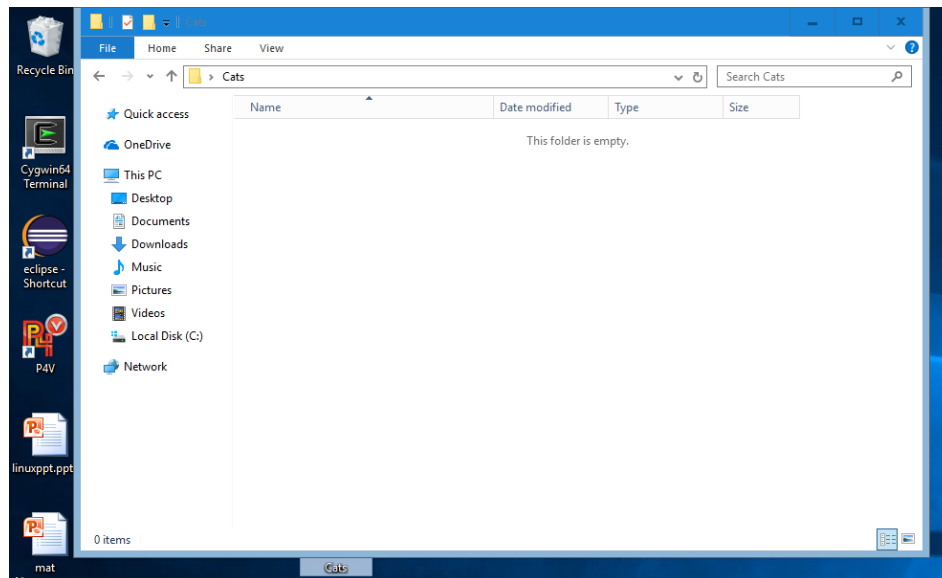

Linux

```
J44482@OC135VictoriaC ~  
$ mkdir cats|
```

Navigating your file system.

cd- enter a directory

Windows

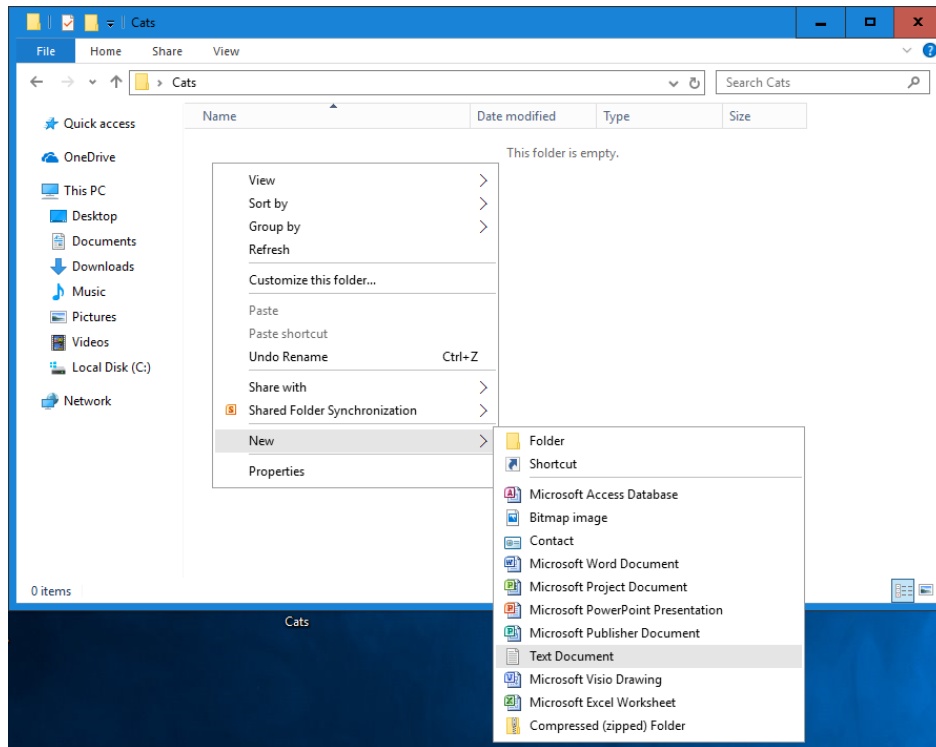

Linux

```
J44482@OC135VictoriaC ~  
$ cd cats  
  
J44482@OC135VictoriaC ~/cats  
$
```

Navigating your file system.

Touch- creating a file Windows

Linux

```
J44482@OC135VictoriaC ~/cats
$ touch typesofcats.txt

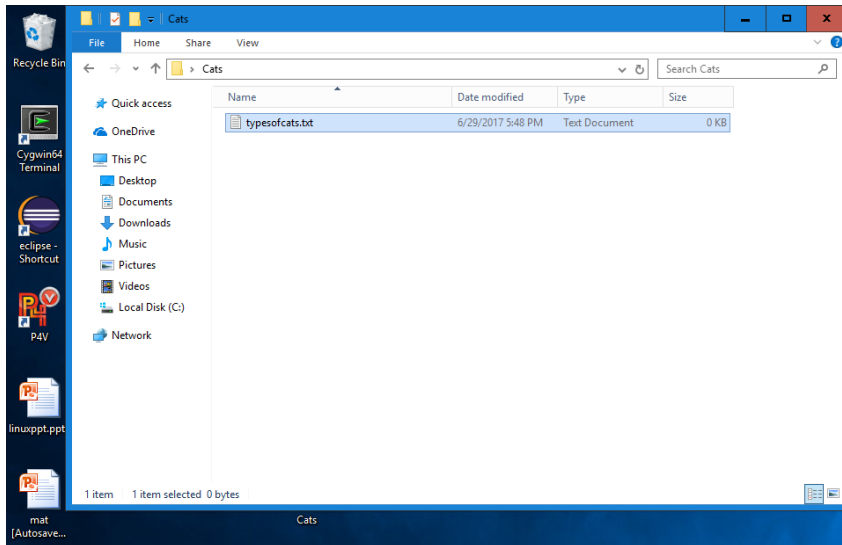

J44482@OC135VictoriaC ~/cats
$
```

Navigating your file system.

ls- see what is inside a directory

Windows

Linux

```
J44482@OC135VictoriaC ~/cats  
$ ls  
typesofcats.txt  
  
J44482@OC135VictoriaC ~/cats  
$
```

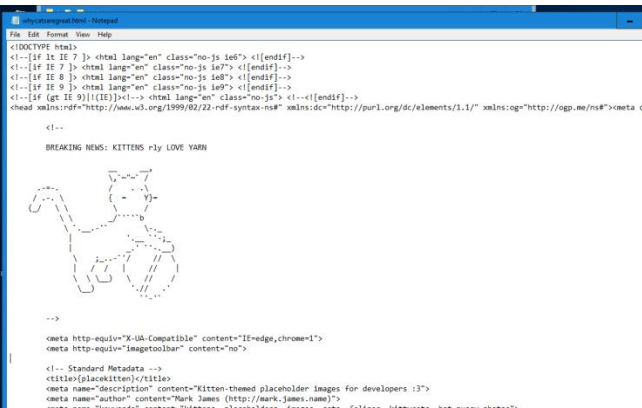

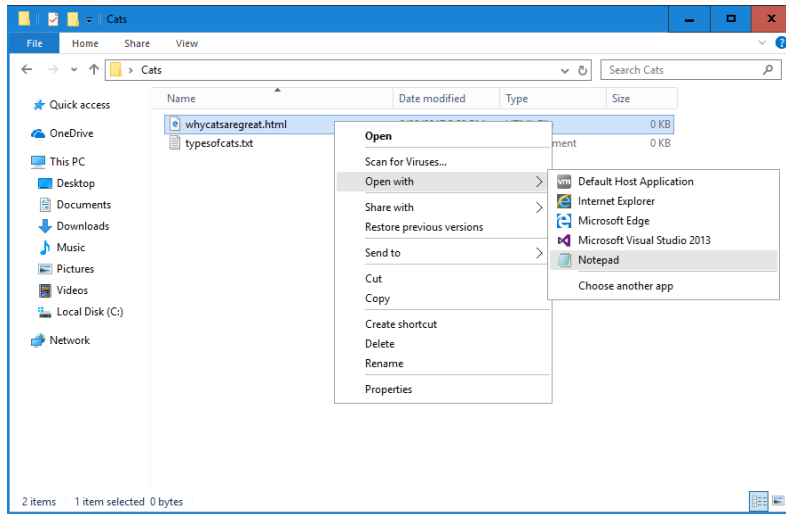

Navigating your file system.

vi-make,edit, save a file

You can substitute vi with gedit, nano, emacs, etc.

Windows

name	date modified	type	size
whycatsaregreat.html	6/29/2017 5:58 PM	Text Document	0 KB
typesofcats.txt	6/29/2017 5:48 PM	Text Document	0 KB

Linux

A short detour to vim

Vi/m is a text editor sort thing that is somewhat wonky. However, I strongly urge you to learn it because it is highly customizable and when you customize it and master it you will be able to code much faster.

Vim has an insert mode.

You press “i” and then you can type, but unless your vim is customized you wont be able to use arrow keys and your backspace will be wierd.

When you are done typing press escape and you will be able to use arrow keys again and you can press x to delete things you don’t like and dd to delete entire lines

Other ways to enter insert mode include

a- puts you in insert mode in the space after the cursor

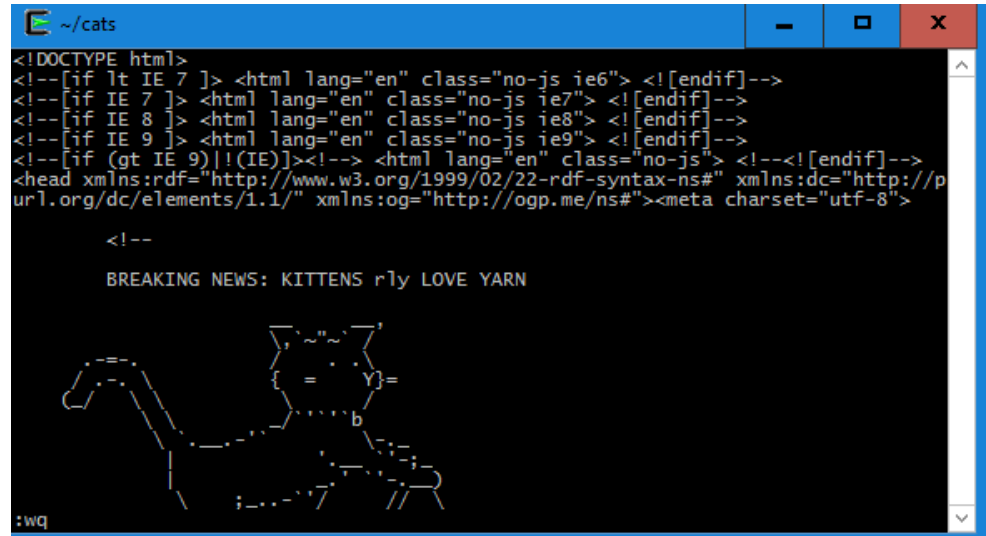

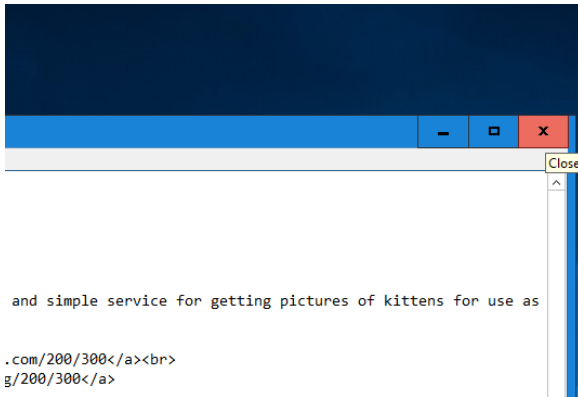

o-puts you in insert mode in the space under your cursor

When you are done and need to save and quit, press escape to get out of insert mode and then type “:wq”. You can also just save with “:w” or just quit with “:q” if you don’t want to save your changes you can exit with “:q!” you may have to do so anyway because vim won’t let you quit without telling it whether or not you are going to save your changes.

Of course vim is the superior text editor, but if you really hate it, you can always use nano, gedit, or any other text editor available to you.

Navigating your file system.

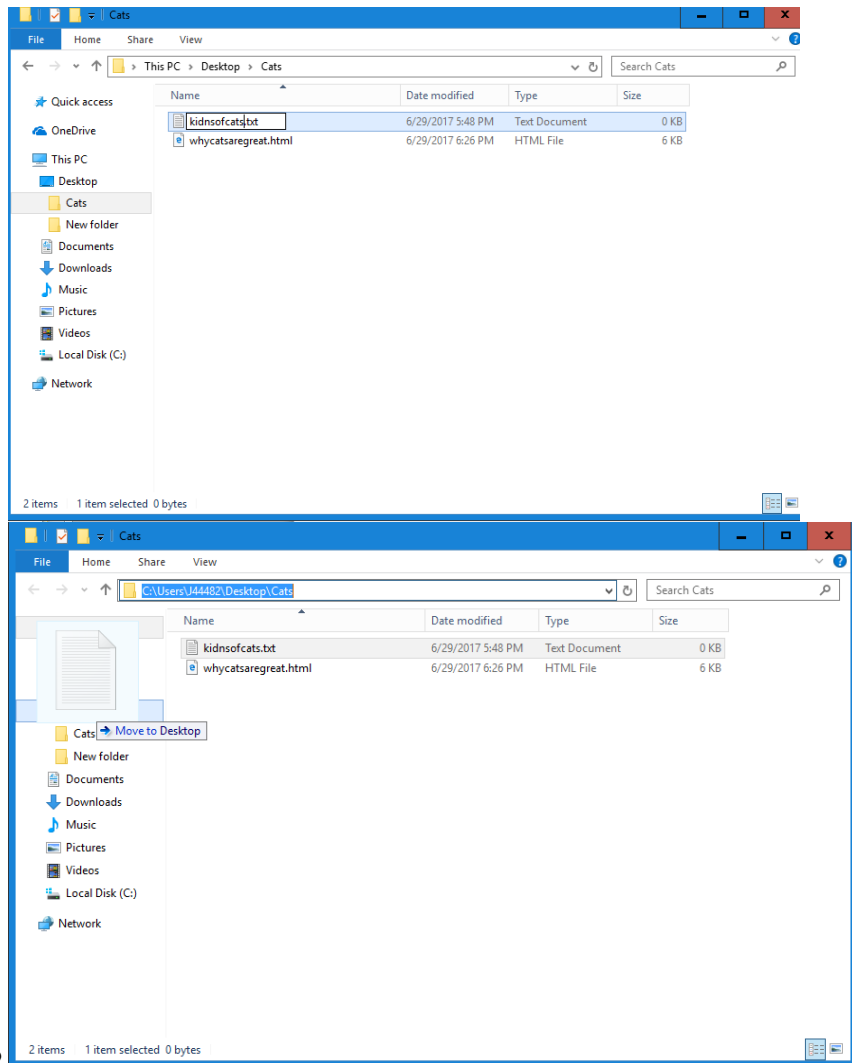

ESC-:wq(not a terminal command)- saving and exiting your text editor
Windows
Linux

Navigating your file system.

mv: moving your file/renaming your file

Windows

Linux

```
J44482@OC135VictoriaC ~/cats
$ mv typesofcats.txt kindsofcats.txt

J44482@OC135VictoriaC ~/cats
$ ls
kindsofcats.txt  whycatsaregreat.html
```

```
J44482@OC135VictoriaC ~/cats
$ mv kindsofcats.txt ../

J44482@OC135VictoriaC ~/cats
$ ls
whycatsaregreat.html

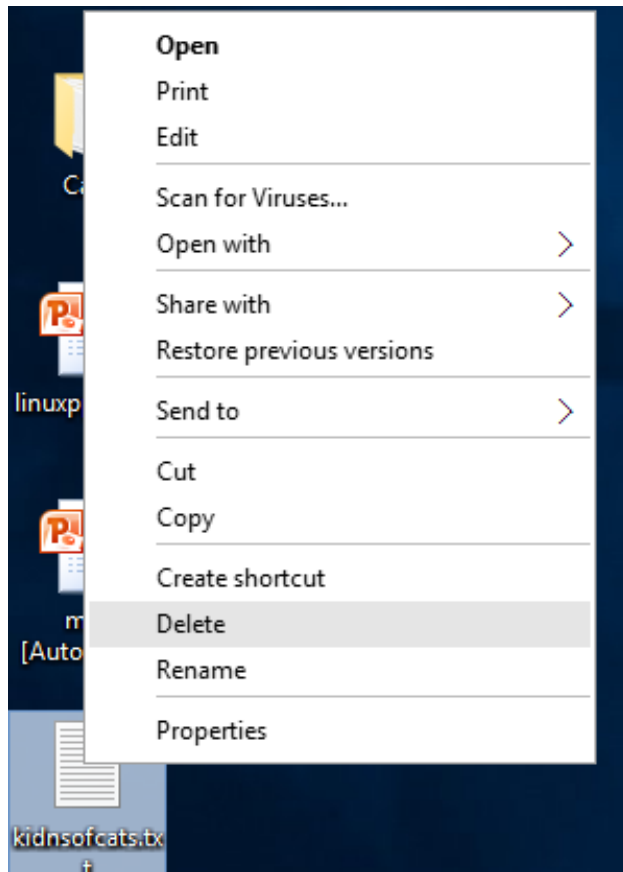

J44482@OC135VictoriaC ~/cats
$ cd ..

J44482@OC135VictoriaC ~
$ ls
cats  kindsofcats.txt
```

Navigating your file system.

rm: remove things

Windows

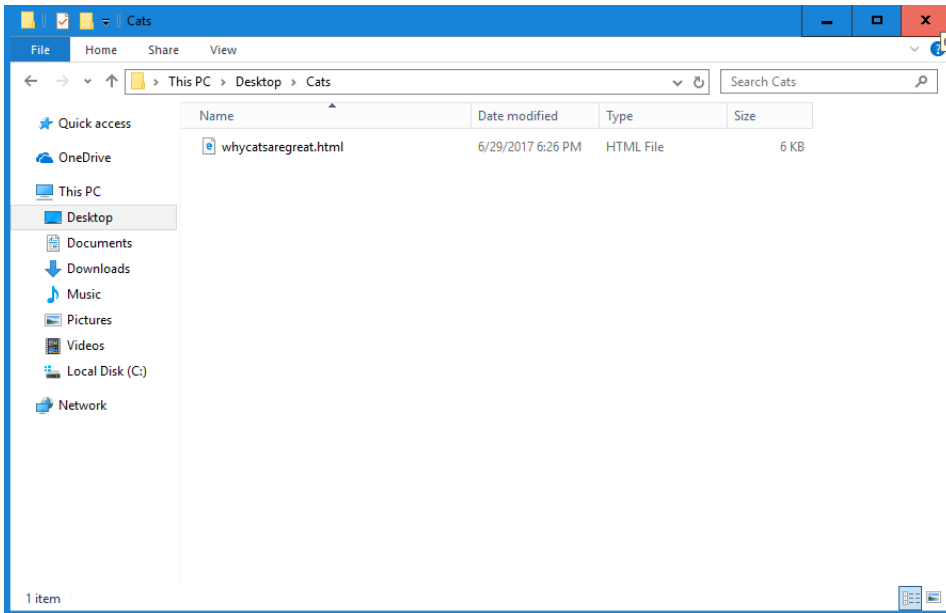

Linux

```
J44482@OC135VictoriaC ~  
$ ls  
cats  kindsofcats.txt  
  
J44482@OC135VictoriaC ~  
$ rm kindsofcats.txt  
  
J44482@OC135VictoriaC ~  
$ ls  
cats  
  
J44482@OC135VictoriaC ~  
$
```

Navigating your file system.

cd..: Getting out of a file
Windows

Linux

```
J44482@OC135VictoriaC ~/cats
$ cd ..

J44482@OC135VictoriaC ~
$
```

Another useful thing

Now try removing the directory you made earlier with rm?

Doesn't work right?

Now run a man rm and this should show up

```
E ~
RM(1)                                User Commands                                RM(1)
NAME
rm - remove files or directories

SYNOPSIS
rm [OPTION]... [FILE]...

DESCRIPTION
This manual page documents the GNU version of rm. rm removes each
specified file. By default, it does not remove directories.

If the -I or --interactive=once option is given, and there are more
than three files or the -r, -R, or --recursive are given, then rm
prompts the user for whether to proceed with the entire operation. If
the response is not affirmative, the entire command is aborted.

Otherwise, if a file is unwritable, standard input is a terminal, and
the -f or --force option is not given, or the -i or --interac-
tive=always option is given, rm prompts the user for whether to remove
the file. If the response is not affirmative, the file is skipped.
```

Scroll Down and this should show up →

We now see that we can use rm -r to recursively delete
A folder and all the things inside it.

Try it!

```
OPTIONS
Remove (unlink) the FILE(s).

-f, --force
    ignore nonexistent files and arguments, never prompt

-i
    prompt before every removal

-I
    prompt once before removing more than three files, or when
    removing recursively; less intrusive than -i, while still giving
    protection against most mistakes

--interactive[=WHEN]
    prompt according to WHEN: never, once (-I), or always (-i);
    without WHEN, prompt always

--one-file-system
    when removing a hierarchy recursively, skip any directory that
    is on a file system different from that of the corresponding
    command line argument

--no-preserve-root
    do not treat '/' specially

--preserve-root
    do not remove '/' (default)

-r, -R, --recursive
    remove directories and their contents recursively

-d, --dir
    remove empty directories

-v, --verbose
    explain what is being done

--help
    display this help and exit

--version
    output version information and exit

By default, rm does not remove directories. Use the --recursive (-r or
-R) option to remove each listed directory, too, along with all of its
contents.

To remove a file whose name starts with a '-', for example '-foo', use
one of these commands:

    rm -- -foo

    rm ./-foo

Note that if you use rm to remove a file, it might be possible to
recover some of its contents, given sufficient expertise and/or time.
For greater assurance that the contents are truly unrecoverable, con-
sider using shred.
```

Installing stuff

Ubuntu: Apt-get install

1. Install Apache

To install Apache you must install the Metapackage apache2. This can be done by searching for and installing in the Software Centre, or by running the following command.

```
sudo apt-get install apache2
```

2. Install MySQL

To install MySQL you must install the Metapackage mysql-server. This can be done by searching for and installing in the Software Centre, or by running the following command.

```
sudo apt-get install mysql-server
```

3. Install PHP

To install PHP you must install the Metapackages php5 and libapache2-mod-php5. This can be done by searching for and installing in the Software Centre, or by running the following command.

```
sudo apt-get install php5 libapache
```

4. Restart Server

Your server should restart Apache automatically after the installation of both MySQL and PHP. If it doesn't, execute this command.

```
sudo /etc/init.d/apache2 restart
```

5. Check Apache

Open a web browser and navigate to <http://localhost/>. You should see a message saying it works!

6. Check PHP

You can check your PHP by executing any PHP file from within `/var/www/`. Alternatively you can execute the following command, which will make PHP run the code without the need for creating a file.

```
php -r 'echo "[nYour PHP install]
```

CentOS: yum install

```
[root@0C135-VicC ~]# yum install httpd mysql-server php php-mysql

=====
Package      Arch      Version      Repository      Size
=====
Installing:
```

Other stuff you need to know

Deleting:

Apt-get purge

Apt-get remove

Updating (ask first?):

Apt-get upgrade

Apt-get update

Starting and stopping:

Service thing start

Service thing stop

Miscellaneous:

Pwd- shows you where you are in the file system

Ctrl-c, ctrl-d, ctrl-z – stop stuff

When in doubt restart your terminal

CyberPatrioting

`sudo netstat -tulpn` gives you a list of things that are running

`Ps -ef` gives a list of tasks, like task manager on windows

`Kill`- kill a task

`|less` -lets you read files with a lot of text with ease

`Cat`: prints all the stuff on a file, use with pipe to less → `cat file |less`

And of course all the commands you learned so far.

Cyberpatrioting

Okay, I kinda lied about getting more points in cyberpatriots. These are just more commands that may be useful to you.

There is no singular command you can use to earn more points in CyberPatriot although you probably already knew that

So to make up for that, here is the complete list of all the linux things we did when I was a CyberPatriot take a look at it on your own time:

Fancy stuff

Cronjobs- jobs linux does daily

Scripting-

Quick demo:

vi midnightTrain in your cronjobs.daily

```
File Edit View Search Terminal Help
a=0
while [ "$a" -lt 100 ]    # this is loop1
do
    sl
done
```

Chmod 755 ./midnightTrain

Crontab -e

Change * * * * * to 0 0 * * * path to file to be executed

Will execute at midnight 100 times

Fancy stuff

Bashrcs- configuration stuff found in your home folder

Edit to set permanent aliases, change the thing that's always there before your commands in the terminal bash prompt? I think it's called and do other cool stuff you should research on your own

Vimrc- configure your vim things. Look online for good examples. Can also make you look like a linux master.

Tmux- the terminal that allows you to terminal while you terminal more terminals
Learn it for fun, and to look like a linux master in college

Database Set up

```
File Edit View Search Terminal Help
41 ls
42 cd etc
43 ls
44 cd ..
45 ls
46 cd
47 sudo apt-get install apache2
48 apt-get install apache2
49 uname -i
50 sudo yum install apache2
51 sudo yum install apt
52 yum install httpd mysql-server php php-mysql
53 mysql_secure_installation
54 service mysqld start
55 systemctl start mysqld
56 systemctl start mysqld.service
57 yum install mysql-server
58 sudo yum install mysql-server
59 yum -y install mariadb-server mariadb
60 sudo systemctl start mariadb.service
61 sudo systemctl enable mariadb.service
62 mysql
63 history
[root@OC135-VicC ~]#
```

Do that

Database Demo: create and show database

Welcome to the MariaDB monitor. Commands end with ; or \g.

Your MariaDB connection id is 3

Server version: 5.5.52-MariaDB MariaDB Server

performance_schema
test

4 rows in set (0.00 sec)

MariaDB [(none)]> create database demoDatabase

-> ;

Query OK, 1 row affected (0.00 sec)

Database Demo: putting stuff into your database

```
itc MariaDB [(none)]> use demoDatabase
:ti Database changed
1 MariaDB [demoDatabase]> select cats
    -> ;
ERROR 1054 (42S22): Unknown column 'cats' in 'field list'
MariaDB [demoDatabase]> select *
    -> ;
ERROR 1096 (HY000): No tables used
MariaDB [demoDatabase]> CREATE TABLE CUSTOMERS(
    -> ID INT NOT NULL,
    -> NAME VARCHAR (20) NOT NULL,
    -> AGE INT NOT NULL,
    -> ADDRESS CHAR (25) ,
    -> SALARY DECIMAL (18, 2),
    -> PRIMARY KEY (ID)
    -> );
Query OK, 0 rows affected (0.01 sec)

MariaDB [demoDatabase]> INSERT INTO CUSTOMERS (ID,NAME,AGE,ADDRESS,SALARY)
    -> VALUES (1, 'Ramesh', 32, 'Ahmedabad', 2000.00 );
Query OK, 1 row affected (0.01 sec)

MariaDB [demoDatabase]> select *
    -> ;
ERROR 1096 (HY000): No tables used
MariaDB [demoDatabase]> select * From customers
    -> ;
ERROR 1146 (42S02): Table 'demoDatabase.customers' doesn't exist
MariaDB [demoDatabase]> select * From CUSTOMERS
    -> ;
ia) +-----+-----+-----+-----+
    | ID | NAME  | AGE | ADDRESS  | SALARY |
    +-----+-----+-----+-----+
    | 1 | Ramesh | 32 | Ahmedabad | 2000.00 |
```

Database Demo: exiting the database

```
MariaDB [demoDatabase]> exit  
Bye
```

Tips for database design

Design it first before making it

Draw the charts and tables if needed

Ask questions like:

What do I need to store,

How do I plan to design the tables (what information to store together, what information to store separately),

Do I need to assign ids to the things I am storing? (ex: usernames and passwords although this is kind of insecure so probably don't do it (if you are given a database to work with and you see things like qid, pid, they are probably ids for the information in that row))

MySQL is literally just charts and tables that your program can read.

Customization

Alias and Sl

Alias allows you to choose what commands do. You can alias `cd` to `ls` for example and your `cd` will now do what `ls` does

This understandably causes problems as now you can't change directories, but not to worry you can exit your terminal and come back and as long as you didn't put the alias permanently in your `bashrc` your terminal should be back to normal.

A fun thing that sometimes happens is when you want to type `ls` but accidentally type `sl`. Linux doesn't understand it and will tell you so, making you type the command again which is moderately annoying

But if for whatever reason you want to make your life more difficult than it already is, you can apt-get install `sl` (with permission of course) which will make an ascii train run across your screen every time you mistype `ls` to `sl`.

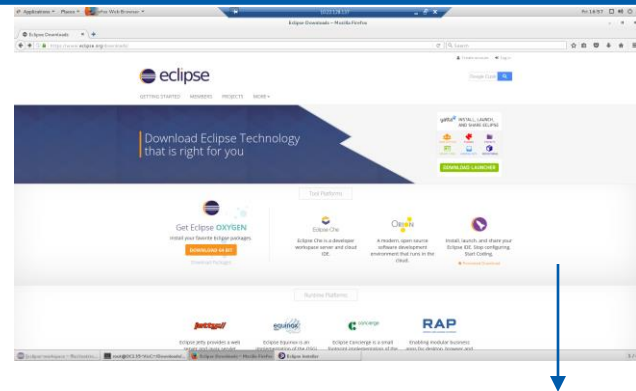

If you want to cause yourself even more pain you can alias `ls` to `sl` causing trains to run every time you type `sl` and `ls` and also rendering you incapable of listing files in a file directory

That which can be done to you can be done to others when their computers are unlocked. Lock your computers friends, both here and in college

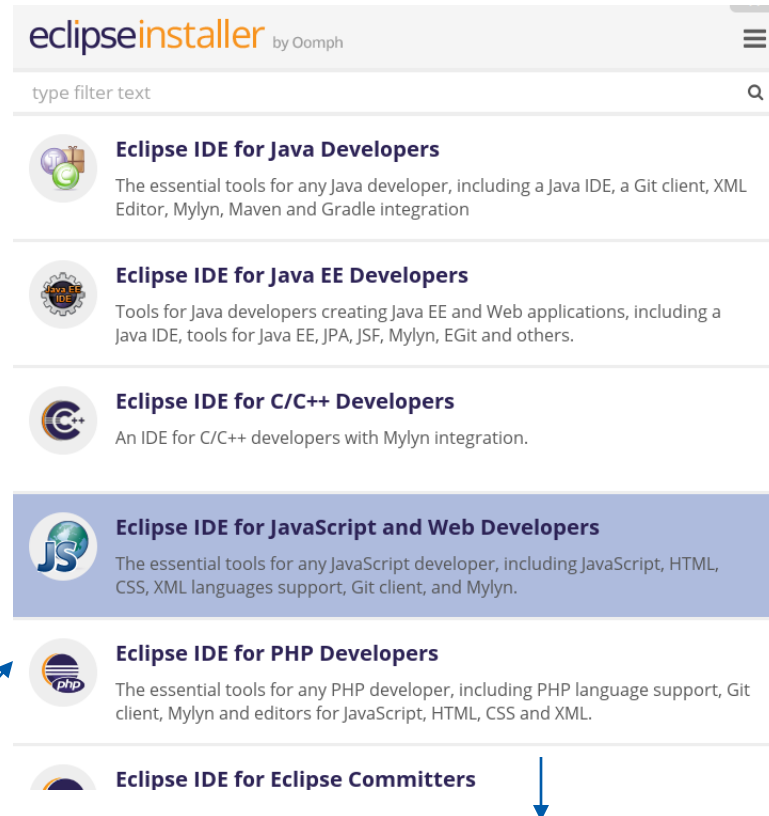

Questions?

How to install eclipse

```
root@OC135-VicC:~/Downloads/eclipse-installer
File Edit View Search Terminal Help
[root@OC135-VicC ~]# ls
ls: cannot access thincient_drives: Transport endpoint is not connected
anaconda-ks.cfg  eclipse           Music           thincient_drives
Desktop          eclipse-workspace Pictures         Videos
Documents        first            Public          xrdp_mkhonedir.txt
Downloads        initial-setup-ks.cfg Templates
[root@OC135-VicC ~]# cd Downloads
[root@OC135-VicC Downloads]# ls
eclipse-installer  eclipse-inst-linux64.tar.gz
[root@OC135-VicC Downloads]# ls
eclipse-installer  eclipse-inst-linux64.tar.gz
[root@OC135-VicC Downloads]# cd eclipse-installer
[root@OC135-VicC eclipse-installer]# ls
artifacts.xml  eclipse-inst  features  p2  readme
configuration  eclipse-inst.ini  icon.xpm  plugins
[root@OC135-VicC eclipse-installer]# ./eclipse-inst
```

Click next install and launch. That should get you to your ide
